

## CLIMATE RESILIENCE ROADMAP™

### *Building Your Community's Climate Resilience*

**Climate-driven events are increasingly disrupting communities.** Local infrastructure, public services, economies, and natural systems will be put to the test with rising seas and more frequent and intense storms, wildfires, heatwaves, droughts, and floods. The risks associated with these events threaten public health, safety, and stability.

### **City staff and local leadership play a unique role in preparing their communities for climate change.**

We understand that with limited resources and capacity and an ever-increasing list of priorities, many cities find it challenging to do the planning needed to adequately prepare.

**Peak Sustainability Group (Peak) specializes in climate planning.** Our Climate Resilience Roadmap™ is a robust and cost-effective process to support small Pacific Northwest cities seeking to address climate change impacts and risk. Our team incorporates the best available climate science, community engagement strategies, and tools to assist communities in prioritizing climate projects and charting a course towards greater climate resilience.

---

### *Our Climate Resilience Roadmap™ puts your community's unique climate needs and opportunities front and center through the following services:*

---

**Explore Climate Vulnerabilities:** Using a systematic climate hazard analysis, Peak will assess the threats that climate change poses to infrastructure, health and safety, and systems that your community relies on.

**Estimate Greenhouse Gas Emissions:** Our team will conduct an estimate of greenhouse gas emissions by sector. While not a full greenhouse gas inventory, this estimate will inform priority emission reduction opportunities in your community.

**Stakeholder Workshop:** Peak facilitators will lead key stakeholders in your community in a workshop setting to identify priority climate resilience projects. The workshop will be informed by the best-available climate science and case study experience of other cities around the world. Over 450 communities have used this established workshop model thus far and are well down the path toward greater climate resilience.

**Apply science-based decision making in your process.**  
**Confidently engage and collect community input.**  
**Establish a clear list of priorities.**  
**Create meaningful actions your city can start work on today.**

Whether your community is taking the first steps towards climate resilience or is looking to expand on past work, our Climate Resilience Roadmap™ is designed to meet you where you are and move your community forward.

The complete package of services ranges from \$15,000 to \$20,000.

*“Peak’s work was essential in producing a quality, credible climate planning project. Peak staff exemplified grace under pressure. I would recommend them without reservation for similar projects involving work of high analytical and political complexity, and with critical real-world importance.”*
